Weingarten competency framework

Deutsche Version

The rapid pace of digital transformation not only changes our daily life, but also has profound effects on education. In order to prepare teachers for the requirements of future teaching environments the transfer of digital competencies is essential.

The Weingarten competency framework of digital skills for teachers builts up on those requirements and serves as a comprehensive foundation which is based on the DigCompEdu framework.

Framework description

The model consists of 3 competencies (“digital school-related competencies”, “media subject-related competencies” and “media education” as well as their overlaps), which are divided into 10 sub-areas. These sub-areas comprise a total of 152(4) individual competencies with their respective title of competencies and description of competencies. The 152(4) competencies are divided into the three-part “basic competencies”, “detail competencies” and “advanced competencies”. The basic competencies are a mixture of competencies, which are at different taxonomy levels (knowledge, application, further development). The university of education Weingarten has derived 8 abstract competencies for its course manual.

Within the area of „digital school-related competencies“, the focus is on enabling prospective teachers to use digital media for professional communication with learners, parents and non-school stakeholders, for cooperation within the school community, for their own professional development and for digital school development in a contextual-based and goal-oriented manner.

In the area of „media subject-related competencies“, prospective teachers are enabled to systematically integrate digital media into their own lessons and thereby unleash the full potential for their own subject.

In „media education“, the focus is on promoting learners' digital-related competencies. Prospective teachers can guide and support learners in their development in the reflective and responsible use of digital media.

10 sub-areas (e.g. innovation & reflective practice) with overlaps („digital resources“ and „learner guidance“) are assigned to the 3 areas of competence. The competencies fall under these ten sub-areas, each of which was assigned to only one taxonomy level in order to make the model applicable and testable in teaching.

This framework is specially designed to serve as a sound basis for the design and implementation of courses, with the aim of equipping prospective teachers both theoretically and practically for an efficient and ethically responsible use of digital technologies in teaching.

Weingarten competency framework divided into 10 sub-areas

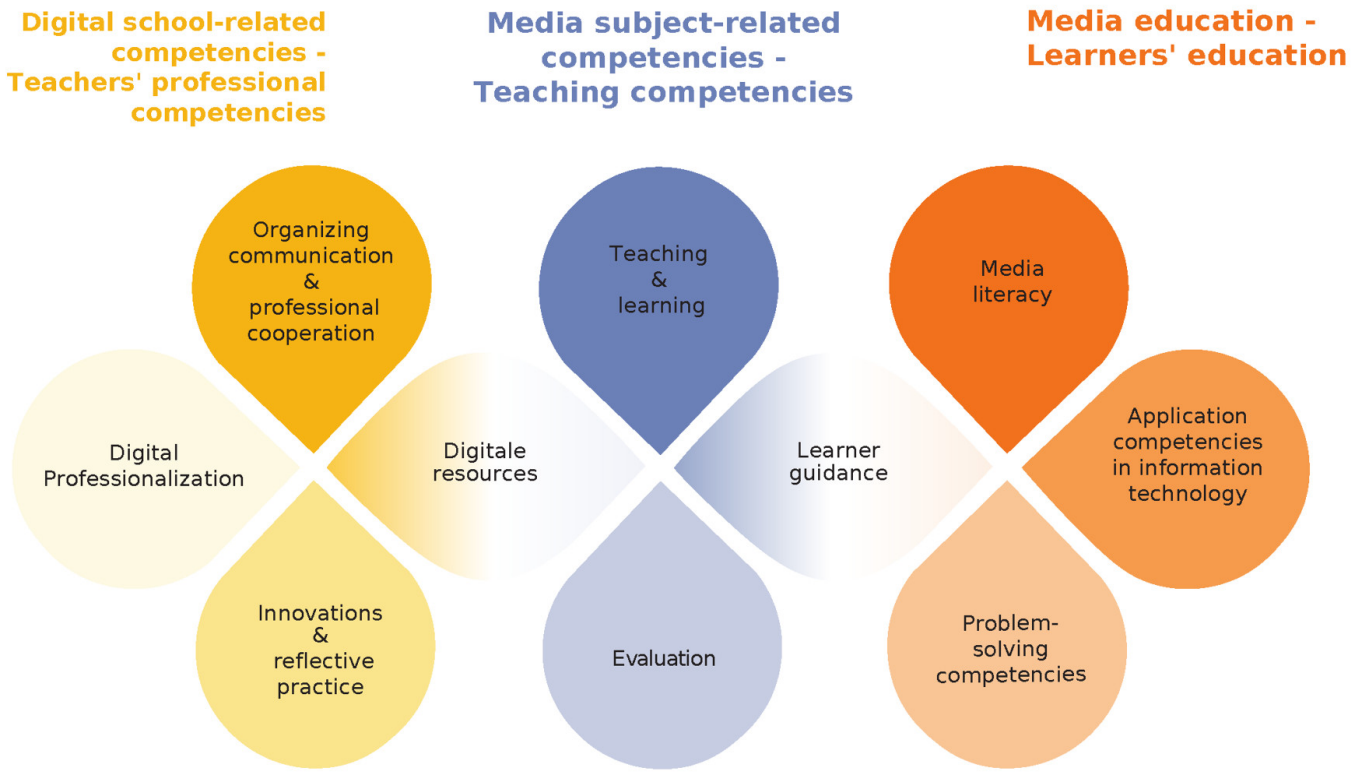

Table overview of the weingarten competency model

The table below describes the Weingarten model in its entirety. The table is divided into three levels, the 3 competency levels. The „basic competencies“, „detailed competencies“ and „advanced competencies“. Within each competency level, there are the 3 competencies areas mentioned above: „Digital school-related competencies“, „Media subject-related competencies“ and „Media education“. A total of 152(4) competencies are described in this hierarchy.

Basic competencies: Digital school-related competencies

Digital school-related competencies
Organizing communication & professional cooperation (with learners + parents + extracurricular stakeholders/third parties)
1 School and class management
2 Synchronous and asynchronous communication and collaboration
3 Project and knowledge management systems
Digital Professionalization (with other teachers)
4 Professional training
5 Online training
Innovations and reflective practice
6 Evaluation of digital teaching strategies
7 Documentation reflection of own learning activities and competences
8 Exposure to digital technologies
9 Developing innovation processes

Basic competencies: Media subject-related competencies

Media subject-related competencies
Digital resources
Legal foundation
10 Copyright and licenses
11 GDPR
12 Personal rights
Search and sustainability
13 Finding digital resources
14 Media management
15 File organization and tools
Design and instruction principles
16 Design principles media
17 Usability
Media development
18 Software
19 Hardware
Teaching and learning
Learning theory principles & models of instructional design
20 Basic instructional design models
21 Media-based learning
Condition analysis (actors & environment)
22 Market, context and target group analysis
23 Technical and organizational requirements
Teaching content
24 Digital learning environments/ LMS
25 Adequacy of media content
Teaching objectives
26 Educational problem
27 Media teaching goal definition
Teaching methods
28 Expository and exploratory methods
29 Problem based and cooperative methods
Media
30 Digital information and communication media
31 E-learning
32 Synchronous and asynchronous management
Evaluation
Learning diagnosis / diagnostics
33 Learning outcome diagnosis/ learning requirements
34 Learning progress
Feedback and planing
35 Digital feedback possibilities
Learner guidance
Learning prerequisites

Media subject-related competencies
36 Socioeconomic factors
37 Technical instruction
Learner activation
38 Cognitive activation
39 Contextual teaching
40 Instruction in open forms of teaching

Basic competencies: Media education

Media education
Media literacy
41 Media literacy
Application competencies in information technology
42 Media projects
43 Media usage
44 Communication and code of conduct
45 Role play in media-based education
Problem-solving competency
Pleasure and addiction
46 Media and data awareness
47 Communication culture
48 Selection capability
49 Media effects
50 Basics of information technology

Detail competencies: Media subject-related competencies
